

HOTEL ANALYTICS DASHBOARD

Insights, Key Findings & Business Recommendations

Prepared from the Power BI dashboard provided by Sintu Chauhan

1. Executive Summary

The dashboard shows strong overall hotel demand with 57.87% occupancy and approximately ₹170.9 crore in realized revenue from about 135K bookings. However, the dashboard also highlights a material revenue-realization gap: approximately ₹200.8 crore of revenue was generated while ₹170.9 crore was realized, leaving about ₹29.9 crore in leakage, or roughly 14.9% of generated revenue. Booking cancellations are around one-quarter of bookings, making booking conversion and revenue realization an important management focus.

Performance also differs materially by hotel. Atliq Blu has the highest occupancy at 62.02%, while Atliq Seasons is lowest at 44.62%. RevPAR ranges from about ₹7.82K at Atliq Exotica to ₹6.53K at Atliq Grands. This indicates that hotel-level actions should be targeted rather than applying one identical strategy across all properties.

2. KPI Snapshot

KPI	Dashboard Result	Business Meaning
Revenue Realized	₹1,709M (~₹170.9 Cr)	Revenue actually realized
Total Bookings	135K	Overall booking volume
Occupancy	57.87%	Room utilization level
ADR	₹18.10K	Average daily room rate
RevPAR	₹7.35K	Revenue per available room

KPI	Dashboard Result	Business Meaning
Revenue Generated	₹2,008M (~₹200.8 Cr)	Revenue before leakage
Revenue Leakage	₹299M (~₹29.9 Cr)	Generated minus realized

3. Hotel-wise Findings

Hotel	Occupancy	RevPAR
Atliq Blu	62.02%	₹7.42K
Atliq Palace	60.00%	₹7.72K
Atliq City	59.51%	₹7.29K
Atliq Bay	58.41%	₹7.10K
Atliq Exotica	57.26%	₹7.82K
Atliq Grands	52.60%	₹6.53K
Atliq Seasons	44.62%	₹7.41K

- Finding 1 – Occupancy varies significantly: Occupancy ranges from 44.62% at Atliq Seasons to 62.02% at Atliq Blu, a spread of 17.40 percentage points. This indicates different demand and/or utilization conditions across properties.
- Finding 2 – High occupancy does not automatically mean highest RevPAR: Atliq Blu leads occupancy, but Atliq Exotica has the highest RevPAR (₹7.82K). RevPAR combines room rate and room availability, so management should evaluate occupancy and pricing together.
- Finding 3 – Atliq Seasons needs a different revenue strategy: Its occupancy is the lowest at 44.62%, while its RevPAR is relatively strong at ₹7.41K. The dashboard therefore suggests that low occupancy should not be addressed only through discounting; rate integrity and demand generation should be considered together.
- Finding 4 – Atliq Grands shows a dual opportunity: Occupancy is 52.60% and RevPAR is ₹6.53K, the lowest RevPAR shown. This property may require both demand-building and revenue-management attention.

4. Revenue Leakage Analysis

The waterfall visual shows approximately ₹2,008M generated revenue, approximately ₹299M of leakage, and approximately ₹1,709M realized revenue. The gap is about 14.9% of generated revenue. In business terms, a meaningful portion of potential revenue does not convert into realized revenue.

Likely operational areas to investigate: cancellations, no-shows, booking modifications, refunds/discounts, and differences between booked value and realized value. The dashboard alone shows the gap but does not prove which single operational cause is responsible for all leakage.

Recommended action: create a weekly Revenue Leakage tracker by hotel, booking platform, room class, month, and booking status. Management should monitor Generated Revenue, Realized Revenue, Leakage Amount, and Leakage % together.

5. Booking Status Findings

The booking-status visual shows roughly 70% Checked Out, about 25% Cancelled, and about 5% No Show. The exact values differ slightly by hotel, with cancellations around 24–25% across the displayed properties.

Business implication: cancellations represent a substantial booking volume and are an important area for revenue-protection analysis. Because the dashboard is a descriptive view, it should not be used to conclude

that a particular booking platform causes cancellations without additional analysis of cancellation rates after controlling for hotel, room class, dates, and booking type.

6. Weekend vs Weekday Finding

The dashboard shows materially higher occupancy on weekends (73.58%) than weekdays (51.34%). This indicates a clear day-type demand difference in the displayed period.

Business opportunity: weekday demand can be supported through corporate packages, business-travel offers, targeted promotions, meeting/event packages, and flexible pricing. Weekend demand can be managed through rate optimization and minimum-stay or package strategies where appropriate.

7. Booking Length of Stay Findings

The length-of-stay chart shows that the largest booking bucket is around 64K bookings, followed by a second bucket of roughly 32K. The remaining displayed buckets are smaller, approximately 7K–13K each.

Business implication: the portfolio appears to be driven heavily by shorter stays. Hotels can test longer-stay packages, weekday extension offers, and 'stay one more night' campaigns to improve room utilization, particularly during lower-demand weekdays.

8. Booking Platform Findings

The dashboard includes booking-platform filtering, and the displayed hotel status bars show cancellation shares close to one-quarter across properties. This makes platform-level analysis useful, but the screenshot does not provide enough detail to attribute performance differences to any one platform.

Recommended analysis: compare each platform on Booking Volume, Cancellation %, No-show %, Realization %, ADR, Revenue Realized, and Revenue Leakage %. This will separate high-volume channels from high-quality revenue channels.

9. Key Business Insights - Final Findings

- Overall occupancy is 57.87%, indicating moderate room utilization with additional demand available.
- Approximately ₹170.9 Cr of revenue is realized against approximately ₹200.8 Cr generated, creating a ₹29.9 Cr realization gap.
- The revenue leakage is approximately 14.9% of generated revenue.
- Cancellations account for roughly one-quarter of bookings, making booking conversion and cancellation management important.
- Weekend occupancy (73.58%) is substantially higher than weekday occupancy (51.34%), showing a clear demand imbalance.
- Atliq Blu has the highest occupancy at 62.02%, while Atliq Seasons has the lowest at 44.62%.
- Atliq Exotica has the highest RevPAR at ₹7.82K, while Atliq Grands has the lowest shown RevPAR at ₹6.53K.
- The hotel-level results show why occupancy, ADR and RevPAR should be reviewed together rather than using occupancy alone.
- The large short-stay booking buckets create an opportunity to test longer-stay and weekday extension offers.

10. Business Recommendations

Reduce Revenue Leakage: Track the ₹29.9 Cr gap by hotel, booking status, platform, room class and month. Build a leakage alert when Leakage % exceeds the hotel's normal range.

Improve Cancellation Conversion: Review cancellation reasons and cancellation lead time. Test clearer cancellation policies, confirmation messages, reminder communications and suitable advance-payment/deposit rules.

Control No-Shows: Use pre-arrival reminders and reconfirmation workflows. Where appropriate, test policies that reduce financial exposure from no-shows while remaining customer-friendly.

Increase Weekday Occupancy: Use corporate rates, weekday packages, local business partnerships, meetings/events and targeted promotions to narrow the 51.34% weekday versus 73.58% weekend gap.

Protect Weekend Pricing: Because weekend occupancy is already high, prioritize revenue optimization and rate discipline rather than broad discounting.

Property-specific Strategy: Atliq Blu can focus on maintaining occupancy while optimizing rate; Atliq Exotica can study how its strong RevPAR is achieved; Atliq Seasons and Atliq Grands need targeted demand and revenue-management analysis.

Increase Length of Stay: Test one-night extension offers, weekday add-ons and longer-stay packages to convert short stays into additional room nights.

Optimize Booking Channels: Compare platforms using both volume and quality metrics—especially cancellation, realization, ADR and leakage—not volume alone.

Build a Management KPI Review: Create a weekly review containing Occupancy, ADR, RevPAR, Generated Revenue, Realized Revenue, Leakage %, Cancellation %, No-show %, and Weekday/Weekend Occupancy.

11. Suggested Management Action Plan

Priority	Action	Metric to Monitor
1	Investigate revenue leakage by status and property	Leakage ₹ and Leakage %
2	Analyze cancellation reasons and lead time	Cancellation %
3	Increase weekday demand	Weekday Occupancy
4	Improve no-show prevention	No-show % / Realized Revenue
5	Optimize hotel-level pricing	ADR + RevPAR
6	Test longer-stay offers	Average Length of Stay
7	Evaluate booking platforms	Volume + Realization % + Leakage %

12. Conclusion

The dashboard indicates a hotel portfolio with solid demand but meaningful opportunities in revenue realization, weekday occupancy, cancellation management and property-level optimization. The most important management approach is to move from headline KPIs to root-cause analysis: identify where revenue is being lost, understand which customer and booking characteristics drive cancellations and no-shows, and then apply targeted actions by hotel, day type, platform and room category.

Portfolio-level message: protect existing high-demand periods, improve low-demand weekday utilization, and reduce the gap between generated and realized revenue.

Note: All numerical findings in this document are read from the supplied dashboard screenshot. Where a chart does not expose full underlying detail, the recommendation is framed as an analysis to perform rather than a confirmed causal conclusion.
